

# NovaTech Account Security Policy

## Account Protection

All NovaTech customer accounts use adaptive security monitoring. The system continuously evaluates unusual login patterns, geographic anomalies, and device trust scores.

Accounts showing suspicious activity may be temporarily locked until verification is completed.

## Multi-Factor Authentication

Enterprise customers must enable MFA for all administrator accounts.

Supported MFA methods:

- authenticator applications
- hardware security keys
- biometric verification
- SMS backup codes

SMS authentication is discouraged for high-security enterprise environments.

## Password Recovery

Password recovery requests require:

- email verification
- trusted-device confirmation
- recent activity validation

Accounts with failed verification attempts exceeding five attempts enter temporary lockdown mode for 30 minutes.

## Incident Escalation

Security incidents categorized as Critical Severity are escalated directly to the Security Response Team.

Examples:

- credential leakage
- suspicious API activity
- mass login failures
- enterprise tenant compromise
